## Numerical Optimization - Sheet 12

If you are a student in mathematics please solve the exercises with no tag and the ones with the tag Mathematics. If you are a data science student please solve the problems with no tag and those with the tag Data Science. Submissions with tags other than your subject count as bonus points. The tag Programming marks programming exercises.

Consider the problem

$$\min x_1^2 + 4x_1x_2 + 5x_2^2 - 10x_1 - 20x_2$$
  
s.t.  $2 - x_1 - x_2 = 0$ .

- (i) Implement the quadratic penalty algorithm as described in Section 6.1.1 in the script. Use scipy.optimize.minimize to solve the unconstrained sub-problems.
- (ii) Test it on the above problem with tol=  $10^{-7}$ ,  $\mu = (10, 10^3, 10^5, 10^7)$ .
  - Plot the error of the solution against the number of steps (i.e. the index k of  $\mu_k$ ) in the penalty method.
  - Plot the condition of the inverse hessian in the solution against  $\mu_k$ . You can use np.linalg.cond, and you might want to use a log-log-scaling.

*Hint:* The result of scipy.optimize.minimize contains the solution and the hessian inverse (or its approximation) which you can use to obtain a condition number. You find the details in the documentation.

Let  $x \in \mathbb{R}^2$ , and  $\lambda \in \mathbb{R}$ . Consider the problem

$$\begin{bmatrix} 1 & 0 & 1 \\ 0 & 0 & -1 \\ 1 & -1 & 0 \end{bmatrix} \begin{pmatrix} x_1 \\ x_2 \\ \lambda \end{pmatrix} = \begin{pmatrix} 1 - x_1 \\ 1 \\ 0 \end{pmatrix}.$$

Recover the quadratic problem which is solved by the linear system.

**Ex 3** (2 Points)

Assume  $f,g:\mathbb{R}^n\to\mathbb{R}$  are sufficiently smooth functions, and  $A,B\in\mathbb{R}^{m\times n}$ . Construct the KKT-system of the quadratic subproblem of the SQP-method corresponding to the following nonlinear problems.

(i)

$$\min_{\theta,z} \frac{1}{2} z^2$$

c t

$$z = g(\theta)$$

(ii)

$$\min_{\alpha,\beta} f(\alpha) + g(\beta)$$

s.t.

$$A\alpha + B\beta = 0$$

 $\it Hint:$  The relevant material is presented in lecture 20 and 21.
